CAPACITY AND BALANCE FOR IN-FIELD PRODUCTIVITY

New liquid tanks from 360 Yield Center deliver the things you need for an efficient on-planter liquid system: weight balance, capacity, visibility, and accessibility.

These sleek 700-gallon capacity tanks follow the contour of your tractor - providing improved front and side visibility compared to other mid-mount and front mount tanks. And the unique shape and mount positions provide better fore and aft weight distribution - to minimize pinch-row compaction. And, unlike most mid-mount tanks, the 360 liquid tanks do not increase transport width.

MORE UNIFORM WEIGHT DISTRIBUTION

The high-capacity tanks keep the weight distribution more similar to the original tractor set up. That minimizes the front axle loading and compaction compared to front mounted tanks.

RUGGED SUPPORT STRUCTURE

The support frame is a modular design for easier shipping and installation. The frame cradles the poly tanks providing a secure and solid platform.

KEY FEATURES

The tanks do not add to transport width. And, you still have access to the tractor's side panels for servicing.

The low-profile tank design improves front and side visibility from the cab.

Systems are available for select models of John Deere 8000R & 8030 series tractors as well as select models of Case IH tractors. Check with Sprayer Specialties to find exact model availability.

BASE TANK KIT (Includes two tanks, steel frame and hardware, under-tractor support, and front shutoff valves under each tank.)

COMPATIBILITY AND OPERATING NOTES:

- Front Duals are required for 360 Tank operation. Check tire load ratings prior to operation.
- Tire diameter should not exceed 63".
- Tire spacing wider than 30" requires additional vertical clearance. Order "Rigid" systems for tractors with wider spacing.
- Once installed, check tire clearance before operating.
